

TalkPCR Version 2.4

Release Note 7th April 2000.

Welcome to TalkPCR version 2.4

To install this version, simply run the setup programme.

If you are a registered user this version will run with your existing registration key.

If you install over your existing version TalkPCR will keep all your existing settings, held in your TalkPCR.ini.

But please ensure that you do keep a back up of your TalkPCR.Key or any other valuable files, in case things go wrong.

New to version 2.4

1. Fully tested and working on Windows 2000.
2. Pause time control for main radio form.
3. Auto Recorder adjustable delay before a new recording file is created.
4. The Audio VU meter now has four colour bands, Green below -6dB, yellow -6 to -3 dB, Orange -3dB to -2dB and Red for the top 1dB region. There is also an option to change the range of the scale to 50/30/20 or 10dB.
See updated help file for details of these new features.

Bug fixes.

1. The conflict with Norton Anti Virus should be cleared, this sometimes caused a long delay or even an apparent system crash on start up and close down.
2. Up/Down arrow keys now work the correct way with the slider controls.
3. Audio playback should be more reliable at opening short files, and also after the right click on the PlayLast button.
4. The Channel Edit form has been modified for the PCR100.

There are also many other minor fixes, like the auto rec button will start a recording immediately if a signal is present, recording is properly disabled when the Record Format form is open, the free space and size of hard disks is now correctly reported, and more.

Pete Mahy,

QROSoft Ltd.
